Examination of BIOPLAST on suitability for piercing jewellery (PA.-Nr. 2140)

In answer to your inquiry on 2002-05-06 we can give the following information about the material "BIOPLAST" Corresponding to the current state of knowledge it represents a material, which is considered to be safe for the production of piercing jewellery as far as biocompatibility is concerned.

We specially point out, that the above examination applies to the material itself but not automatically to products made of it. However if products are prepared in good and constant quality and are processed according to the guidelines issued by "Borealis" they are assumed to be safe as well. In case of doubt the safeness of the products has to be proven by means of appropriate tests.

Kind Regards
